

## RAF KINASE INHIBITORS

### Background of the Invention

The p21<sup>ras</sup> oncogene is a major contributor to the development and progression of human solid cancers and is mutated in 30% of all human cancers; Bolton et al., Annual Reports in Medicinal Chemistry, 29, 165-174 (1994); Bos, Cancer Res., 49, 4682 (1989).

In its normal, unmutated form, the ras protein is a key element of the signal transduction cascade directed by growth factor receptors in almost all tissues. See J. Avruch et al., TIBS (19), 279-283 (1994). Biochemically, ras is a guanine nucleotide binding protein, and cycling between a GTP-bound activated and a GDP-bound resting form is strictly controlled by ras' endogenous GTPase activity and other regulatory proteins. In the ras mutants in cancer cells, the endogenous GTPase activity is alleviated and, therefore, the protein delivers constitutive growth signals to downstream effectors such as the enzyme raf kinase. This leads to the cancerous growth of the cells which carry these mutants, Magnuson et al., Cancer Biology, 5, 247-253 (1994). It has been shown that inhibiting the effect of active ras by inhibiting the raf kinase signaling pathway by administration of deactivating antibodies to raf kinase or by co-expression of dominant negative raf kinase or dominant negative MEK, the substrate of raf kinase, leads to the reversion of transformed cells to the normal growth phenotype. See Daum et al., TIBS 19, 474-480 (1994), and Fridman et al., J. Biol. Chem., 269, 30105-30108 (1994). Kolch et al., Nature, 349, 426-428 (1991), have further indicated that inhibition of raf expression by antisense RNA blocks cell proliferation in membrane-associated oncogenes. Similarly, inhibition of raf kinase (by antisense oligodeoxynucleotides) has been correlated in vitro and in vivo with inhibition of the growth of a variety of human tumor types; Monia et al., Nature Medicine, 2(6):668-675 (1996).

The compounds may be administered orally, topically, parenterally, by inhalation or spray or rectally in dosage unit formulations. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques. One or more compounds may be present in association with one or more non-toxic pharmaceutically acceptable carriers and if desired other active ingredients. The preferred method of administration is parenteral.

Compositions intended for oral use may be prepared according to any suitable method known to the art for the manufacture of pharmaceutical compositions. Such compositions may contain one or more agents selected from the group consisting of diluents, sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; and binding agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and adsorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. These compounds may also be prepared in solid, rapidly released form.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending

agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropyl-methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example, lecithin, or condensation products or an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening, flavoring and coloring agents, may also be present.

The compounds may also be in the form of non-aqueous liquid formulations, e.g., oily suspensions which may be formulated by suspending the active ingredients in a vegetable oil, for example arachis oil, olive oil, sesame oil or peanut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide palatable oral preparations. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

5

The compounds may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

10

It will be appreciated by those skilled in the art that the particular method of administration will depend on a variety of factors, all of which are considered routinely when administering therapeutics.

15

The compounds of the invention are typically employed at a dosage of 0.01 to 200 mg/kg per day, preferably 200 mg/kg ip.

20

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, and rate of excretion, drug combination and the severity of the condition undergoing therapy.

25

The compounds of the invention are inhibitors of the enzyme raf kinase. Since the enzyme is a downstream effector of p21<sup>ras</sup>, the instant inhibitors are useful in pharmaceutical compositions for human or veterinary use where inhibition of the raf kinase pathway is indicated, e.g., in the treatment of tumors and/or cancerous cell growth mediated by raf kinase. In particular, the compounds are useful in the treatment of human or animal, e.g., murine, solid cancers, since the progression of these cancers is dependent upon the ras protein signal transduction cascade and therefore susceptible to treatment by interruption of the cascade, i.e., by inhibiting raf kinase.

30

The activity of a given compound to inhibit raf kinase can be routinely assayed, e.g., according to procedures disclosed herein.

35

In such an in vitro kinase assay, raf is incubated with MEK in 20 mM Tris-HCl, pH 8.2 containing 2 mM 2-mercaptoethanol and 100 mM NaCl. Twenty microliters of this protein solution are mixed with 5 µl of water or compounds diluted with distilled

water from 10 mM stock solutions of compounds dissolved in DMSO. The kinase reaction is initiated by adding 25  $\mu$ l [ $\gamma$ - $^{33}$ P]ATP (1000-3000 dpm/pmol) in 80 mM Tris-HCl, pH 7.5, 120 mM NaCl, 1.6 mM DTT, 16 mM  $MgCl_2$ . The reaction mixtures are incubated at 32°C, usually for 22 minutes and incorporation of  $^{33}$ P into protein is assayed by harvesting the reaction onto phosphocellulose mats, washing away free counts with 1% phosphoric acid and quantitating phosphorylation by liquid scintillation counting. For high throughput screening, 10  $\mu$ M ATP and 0.4  $\mu$ M MEK are used. In some experiments, the kinase reaction is stopped by adding an equal amount of Laemmli sample buffer. Samples are boiled 3 minutes and the proteins resolved by electrophoresis on 7.5% Laemmli gels. Gels are fixed, dried and exposed to an imaging plate (Fuji). Phosphorylation is analyzed using a Fujix Bio-Imaging Analyzer System. Protein kinase C (0.05 mU; Boehringer Mannheim) phosphorylation of histone H1 is assayed according to manufacturer's instructions.

For in vitro growth assay, untransformed NIH3T3 fibroblast or transformed fibroblasts stably expressing their v-H-ras, v-Raf or v-fos are obtained (Onyx). The fibroblast lines are maintained in Dulbecco's Modified Eagle's Medium with high glucose containing 10% fetal bovine serum and 200 mM glutamine. Human colon carcinoma cell lines, DLD-1, Colo 205 and HCT116 are obtained from ATCC (Rockville, MD) and maintained in RPMI with 10% fetal bovine serum and 200 mM glutamine. Cell culture media and additives are obtained from Gibco/BRL (Gaithersburg, MD) except for fetal bovine serum (JRH Biosciences, Lenexa, KS). In some experiments,  $3 \times 10^3$  cells are seeded into 96-well plates and allowed to grow overnight at 37°C in a 5%  $CO_2$  incubator. Proliferation is determined by allowing the cells to incorporate  $^3H$ -thymidine during the last 18 hours of culture, harvesting cells onto glass fiber mats and measuring  $^3H$ -thymidine incorporation by liquid scintillation counting.

These assays establish that the compounds of formula I are active to inhibit raf kinase activity and to inhibit oncogenic cell growth.

An in vivo assay of the inhibitory effect of the compounds on tumors (e.g., solid cancers) mediated by raf kinase can be performed as follows:

CDI nu/nu mice (6-8 weeks old) are injected subcutaneously into the flank at  $1 \times 10^6$  cells with human colon adenocarcinoma cell line. The mice are dosed ip at 50, 100, and 200 mg/kg beginning on day 10, when tumor size is between 50-100 mg. Animals are dosed for 10 consecutive days once a day; tumor size was monitored with calipers twice a week to day 35.

The inhibitory effect of the compounds on raf kinase and therefore on tumors (e.g., solid cancers) mediated by raf kinase can further be demonstrated in vivo according to the technique of Monia et al., Nature Medicine, 2(6):668-675 (1996).

Accordingly, the compounds of the invention are useful in treating solid cancers, such as, for example, carcinomas (e.g., of the lungs, pancreas, thyroid, bladder or colon, myeloid disorders (e.g., myeloid leukemia) or adenomas (e.g., villous colon adenoma).

The compounds of formulae 1-31 are producible from known compounds (or from starting materials which, in turn, are producible from known compounds), e.g., through the general preparative methods shown below:

The residue was purified by flash chromatography using hexane/dichloromethane mixtures to yield 265 mg (68%) of Example 1 as a foam. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.28 (s, 6H), 2.30 (s, 3H), 3.06 (m, 1H), 3.75 (s, 3H), 7.11 (d, 2H), 7.30 (d, 2H), 7.72 (s, 1H), 7.83 (s, 1H), 9.67 (s, 1H).

5-tert-Butyl-3-(3-p-tolyl-ureido)-thiophene-2-carboxylic acid methyl ester (example 2) was synthesized according to this procedure using 3-chloro-4,4-dimethyl-2-pentenitrile in place of the 3-chloro-4-methyl-2-pentenitrile.

Method B

Method C

Synthesis of 5-tert-Butyl-3-(3-p-tolyl-ureido)-thiophene-2-carboxylic acid methylamide. (Example 4)

## Step 1

A solution of methyl-3-amino-5-tert-butylthiophene-2-carboxylate (20.0 g, 93.9 mmol), benzyl chloroformate (80.4 mL, 563 mmol), sodium carbonate (1.10 g, 9.93 mmol), toluene (400 mL) and water (50 mL) was kept at reflux 18 h. Solvent was removed in vacuo and resulting oil dissolved in ethyl acetate, washed with water, brine, dried over magnesium sulfate and concentrated in vacuo affording the corresponding benzyl carbamate ester in quantitative crude yield.

## Step 2

The carbamate ester (13.6 g, 39.2 mmol) was dissolved in saturated methyl amine/methanol (200 mL) in a screw top vessel. Sodium cyanide (0.98 g, 20 mmol) was suspended in the solution. The vessel was sealed and heated to 50 °C for 8 h. The solution was poured into water (500 mL) and extracted with ethyl acetate. The ethyl acetate layer was then washed with water, brine, dried over sodium sulfate, and

concentrated in vacuo. The crude material was purified by flash chromatography with ethyl acetate/hexane affording 2.76 g (20%) of the N-methyl amide carbamate.

### Step 3

5 The carbamate (2.76 g, 8 mmol) was then dissolved in 100 mL of 1:1 48% hydrobromic acid/ acetic acid and heated to 30 °C for 24 h. The acidic solution was cooled and basified to pH 4 with saturated sodium bicarbonate. Methyl amine (4 mL, 2 M) in tetrahydrofuran was added before extraction with methylene chloride. Solvent was removed in vacuo affording 922.5 mg (54%) of the N-methyl amide amine.

### Step 4

15 A solution of the amine (600 mg, 2.83 mmol), p-tolyl isocyanate (356.4 uL, 2.83 mmol) and 2 mL toluene was heated to reflux for 18 h. Solvent was removed in vacuo and the resulting solid was purified by flash chromatography with ethyl acetate/ methylene chloride affording 417 mg ( 44%) of Example 4. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 10.53 (s, 1h); 7.90 (s,1h); 7.29 ( d, 2H, J=8.5Hz); 7.11 (d, 2H, J=8.5Hz); 5.59 (bs, 1h); 2.91 (d, 3H, J=4.9Hz); 2.31 (s,3H);1.38 (s,9H); mp 202-204 °C.

### 25 Step 1

To a dry three-necked flask containing anhydrous methanol (10 mL) kept cold with an ice-water bath was added sodium spheres (116 mg, 5.06 mmol). After the sodium spheres were completely dissolved, methyl thioglycolate (537 mg, 5.06 mmol) was added. After ca. 5 min, a solution of crude 4-(2-tetrahydropyranoxy)-2-butyl-nitrile (0.76 g, 4.60 mmol) [Murray, R.; Zweifel, G., Synthesis, 1980, 150] in methanol (10 mL) was added to the mixture. The mixture was allowed to warm up to rt and maintained at this temperature for 2 h. The mixture was concentrated and the concentrate was partitioned between EtOAc (100 mL) and H<sub>2</sub>O ( 50 mL). The organic layer was washed with brine (2 x 50 mL), dried (MgSO<sub>4</sub>), and concentrated in vacuo. The crude product was purified by Chromatotron (4 mm plate, hexane-EtOAc, 9:1) to afford the aminothiophene (593 mg, 48 %) as an orange oil. <sup>1</sup>H NMR

## Step 2

5 The amine in Step 1 was converted to 5-hydroxymethyl-3-(3-p-tolyl-ureido)-thiophene-2-carboxylic acid methyl ester following Method E using toluidine in place of 2-amino-5-trifluoromethyl-1,3,4-thiadiazole. <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) d 9.86 (s, 1H); 9.48 (s, 1H); 7.83 (s, 1H); 7.34 (d, J = 8.1 Hz, 2H); 7.07 (d, J = 8.5 Hz, 2H); 5.71 (t, J = 5.0 Hz, 1H); 4.61 (d, J = 4.4 Hz, 2H); 3.79 (s, 3H); 2.21 (s, 3H); MS (FAB-LSIMS) 321.2 [M+H]<sup>+</sup>; mp 166-168 °C.

## Step 3

To a solution of 5-hydroxymethyl-3-(3-p-tolyl-ureido)-thiophene-2-carboxylic acid methyl ester (25 mg, 0.078 mmol) in anhydrous DMF (2 mL) was added N-bromosuccinimide (28 mg, 0.156 mmol), and triphenylphosphine (41 mg, 0.156 mmol). The mixture was heated to 50 °C and maintained at this temperature for an hour. The mixture was cooled down to rt. Methanol (0.5 mL) was added to destroy excess reagent. #### Method J

Synthesis of 5-*tert*-Butyl-2-(3-*p*-tolyl-ureido)-thiophene-3-carboxylic acid methyl ester. (Example 26)

## Step 1

Triethyl amine ( 3.04 mL, 21.8 mmol) was added to a solution of methyl cyanoacetate (4.00 g, 40.4 mmol), sulfur (1.29 g, 40.4 mmol) and DMF ( 20 mL) at ambient temperature. 3,3-dimethyl butraldehyde (5.08 g, 40.4 mmol) was added and stirred 1 h before being poured into water (200 mL). Solids were filtered off and filtrate was extracted with ethyl acetate. The acetate layer was filtered through a plug of silica gel and concentrated in vacuo. Purification via flash chromatography afforded 4.19 g (49 %) of methyl 2-amino-5-*t*-butylthiophene 3-carboxylate.

## Step 2

Methyl 2-amino-5-*t*-butylthiophene 3-carboxylate was then condensed with *p*-tolyl isocyanate under conditions described in Method A, Step 2 to produce 29 mg of Example 26 (18%). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 10.37 (s, 1h); 7.32 (d, J=8.5 Hz, 2H); 7.16 (d, J=8.1Hz, 2H); 6.82 (s, 1H); 6.75 (bs, 1h); 3.81 (s, 3H); 2.34 (s, 3H); 1.38 (s, 9H); mp 109-111 °C.

5-*tert*-Butyl-2-(3-phenyl-ureido)-thiophene-3-carboxylic acid methyl ester (example 27) was synthesized according to this method using phenyl isocyanate in place of the *p*-tolyl isocyanate.

5-*tert*-Butyl-2-(3-(5-ethyl-[1,3,4]thiadiazol-2-yl)-ureido)-thiophene-3-carboxylic acid methyl ester (example 28) was synthesized according to this method step 1 then Method E using 2-amino-5-ethyl-1,3,4-thiadiazole in place of the 2-amino-5-trifluoromethyl-1,3,4-thiadiazole.

5-Isopropyl-2-(3-*p*-tolyl-ureido)-thiophene-3-carboxylic acid methyl ester (example 29) was synthesized according to this method step 1 using 3-methyl butraldehyde in place of 3,3-dimethyl butraldehyde followed by Method E using toluidine in place of the 2-amino-5-trifluoromethyl-1,3,4-thiadiazole.

5-Isopropyl-2-[3-(5-methyl-thiophen-2-yl)-ureido]-thiophene-3-carboxylic acid methyl ester (example 30) was synthesized according to this method step 1 using 3-methyl butraldehyde in place of 3,3-dimethyl butraldehyde followed by Method F steps 2 and 3 using 5-methyl-2-thiophene carboxylic acid in place of 3-methyl-2-thiophene-carboxylic acid.
